ACKNOWLEDGEMENTS

This report would not have been possible without access to databases provided by Vermont Health Care Authority and the Department of Health, the Brattleboro Retreat, and the Vermont State Hospital. For the current edition of this report we owe special thanks to Pat Worcester (Health Department), Doreen Lincoln and Scott Hamm (Brattleboro Retreat), and Sheila Pomeroy (Vermont State Hospital).

The data may not be used in any manner that attempts to or does identify, directly or indirectly, any individual physician or patient. The requester agrees to incorporate the following, or a substantially similar, disclaimer in all reports or publications that include public use data. "Hospital discharge data for use in this study were supplied by the Vermont Association of Hospitals and Health Systems-Network Services Organization (VAHHS-NSO) and the Vermont Department of Banking, Insurance, Securities and Health Care Administration (BISHCA). All analyses, interpretations or conclusions based on these data are solely that of [the requestor]. VAHHS-NSO and BISHCA disclaim responsibility for any such analyses, interpretations or conclusions. In addition, as the data have been edited and processed by VAHHS-NSO, BISHCA assumes no responsibility for errors in the data due to coding or processing by hospitals, VAHHS-NSO or any other organization, including [the requestor]."

INTRODUCTION

This report provides a statistical overview of the utilization of inpatient facilities by Vermont residents for psychiatric and substance abuse services during 1990 through 2002. Episodes of hospitalization that occurred in general hospitals in Vermont, New Hampshire, Massachusetts, and neighboring counties of New York and in the Vermont State Hospital, the Brattleboro Retreat, and Veterans Administration Hospitals in Vermont and Massachusetts are included in this overview. The report provides detailed information on utilization of inpatient behavioral health care by Vermont residents, including episodes of hospitalization, patient days, and unduplicated numbers of people served. This information is provided for each of the state's counties and for each of six categories of facilities. Utilization profiles are presented for mental health and for substance abuse treatment, for young people and for adults. Appendices provide demographic characteristics of people served, hospital-specific utilization data, and information on caseload overlap among types of facility. A detailed methodological appendix provides information on the databases used to prepare this report and the methodology for deriving unduplicated counts of people served without reference to unique person identifiers.

HIGHLIGHTS

Numbers of people served and episodes of care increased substantially during the last year of the report period. The number of people hospitalized continued a long term upward trend with a 19% increase between 1999 and 2002. The number of episodes of care also continued a long term upward trend with a 12% increase between 1999 and 2002. The number of patient days reversed an earlier downward trend and increased by less than one percent between 2000 and 2002.

There were significant differences between counties, gender, and age groups in rates of inpatient behavioral health care. In recent years, Rutland, Windsor, and Windham had the highest utilization rates. Men and women had similar hospitalization rates, overall, although differed considerably between different types of facility. Men, for instance, accounted for over three-quarters (78%) of VSH patients, but less than half (44%) of general hospital patients. There were differences among age groups in hospital utilization rate. Since 1999, there were substantial increases in hospitalization rates for children under 13 years of age (61%) and for adults aged 51-65 (40%). During this same time period, there were less substantial increases for the 13-20 (25%) and the 21-35 (28%) age groups. There were only small changes in hospitalization for the 36-50 (+14%) and the 65+ (-11%) age groups.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital. Behavioral health care includes both mental illness and substance abuse.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Population figures used to calculate rates were obtained from the 1990 through 2002 Vital Statistics Reports published by the Vermont Department of Health.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Vermont children and adolescents include residents under the age of 18.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Vermont adults include residents age 18 and older.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Vermont adults include residents age 18 and older.

Population figures used to calculate rates were obtained from the 1990 through 2002 Vital Statistics Reports published by the Vermont Department of Health.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital. Behavioral health care includes both mental illness and substance abuse.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

New York Hospitals	Unknown	Unknown	--		Unknown	

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital. New York hospital data not available prior to 1993.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Summary data for Vermont general hospitals and New Hampshire general hospitals describe the categories as a whole. The "total served" by each category is less than the sum of the individual facilities because some patients are served by more than one facility in the same category. The total number of people "also served in other facilities" is less than the sum of the numbers for the individual facilities for the same reason.

Other New Hampshire Hospitals include Alice Peck, Catholic, Androscoggin, Cottage, Elliot, Littleton, Upper CT Valley, Lakes Region, St. Josephs, Frisbie, Nashua Memorial, Parkland, and N. Conway Memorial. Other Massachusetts Hospitals include Berkshire, VA-Boston, Children's, NE Deaconess, VA-Brockton/West Roxbury, Colley-Dickenson, Mass General, Beth Israel, Lahey Clinic, Brigham and Women, NE Medical Center, U-Mass Medical Center, and other Mass hospitals. New York Hospitals include Albany, Samaritan, Leonard, Champlain Valley, Glens Falls, St Peters, United, Moses-Ludington, and other New York hospitals.

Massachusetts Hospitals	103	2,183	21		Unknown	
VA - Northhampton	41	1,358	33			
Franklin County Medical Center	6	48	8			
North Adams	21	172	8			
Baystate Medical Center	4	50	13			
Other Massachusetts Hospitals	31	555	18			
New York Hospitals	35	369	11		Unknown	

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital. New York hospital data not available prior to 1993.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Summary data for Vermont general hospitals and New Hampshire general hospitals describe the categories as a whole. The "total served" by each category is less than the sum of the individual facilities because some patients are served by more than one facility in the same category. The total number of people "also served in other facilities" is less than the sum of the numbers for the individual facilities for the same reason.

Other New Hampshire Hospitals include Alice Peck, Catholic, Androscoggin, Cottage, Elliot, Littleton, Upper CT Valley, Lakes Region, St. Josephs, Frisbie, Nashua Memorial, Parkland, and N. Conway Memorial. Other Massachusetts Hospitals include Berkshire, VA-Boston, Children's, NE Deaconess, VA-Brockton/West Roxbury, Colley-Dickenson, Mass General, Beth Israel, Lahey Clinic, Brigham and Women, NE Medical Center, U-Mass Medical Center, and other Mass hospitals. New York Hospitals include Albany, Samaritan, Leonard, Champlain Valley, Glens Falls, St Peters, United, Moses-Ludington, and other New York hospitals.

Baystate Medical Center	0	0	--			
Other Massachusetts Hospitals	28	328	12			
New York Hospitals	24	219	9		Unknown	

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital. New York hospital data not available prior to 1993.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

Summary data for Vermont general hospitals and New Hampshire general hospitals describe the categories as a whole. The "total served" by each category is less than the sum of the individual facilities because some patients are served by more than one facility in the same category. The total number of people "also served in other facilities" is less than the sum of the numbers for the individual facilities for the same reason.

Other New Hampshire Hospitals include Alice Peck, Catholic, Androscoggin, Cottage, Elliot, Littleton, Upper CT Valley, Lakes Region, St. Josephs, Frisbie, Nashua Memorial, Parkland, and N. Conway Memorial. Other Massachusetts Hospitals include Berkshire, VA-Boston, Children's, NE Deaconess, VA-Brockton/West Roxbury, Colley-Dickenson, Mass General, Beth Israel, Lahey Clinic, Brigham and Women, NE Medical Center, U-Mass Medical Center, and other Mass hospitals. New York Hospitals include Albany, Samaritan, Leonard, Champlain Valley, Glens Falls, St Peters, United, Moses-Ludington, and other New York hospitals.

Information is derived from the Hospital Discharge Data Set maintained by the Vermont Health Department, and database extracts provided by the Brattleboro Retreat and Vermont State Hospital.

The State of Vermont does not have unique client identifiers across service providers. For this reason, Probabilistic Population Estimation has been used to provide unduplicated counts of people served (with 95% confidence intervals). Estimates of the number of people served by Massachusetts and New York hospitals are not provided because the data is inadequate to provide probabilistic population estimates. Actual person counts are available for Brattleboro Retreat and the Vermont State Hospital.

APPENDIX D

Data Sources

Methodology

References

Data Specifications

The profile of inpatient behavioral health care services provided to residents of the state of Vermont presented in this report are based on analysis of data sets from three sources: the statewide hospital discharge data sets maintained by the Vermont Department of Health, the Vermont State Hospital database maintained by the state Department of Developmental and Mental Health Services, and an extract from the database of the Brattleboro Retreat, Vermont's only private psychiatric hospital.

The statewide Hospital Discharge Data Set includes records that describe every episode of hospitalization in Vermont general hospitals and the Veterans Administration Hospital in White River Junction, as well as every episode of hospitalization of Vermonters in New Hampshire, Massachusetts, and neighboring counties of New York State. Records that describe episodes of hospitalization of Vermonters that were categorized under the Mental Health and Substance Abuse Major Diagnostic Categories (MDCs) were abstracted by Health Department staff and provided to the research team. Each record included the date of birth, gender, and zip code of the patient, the beginning and end dates that define each episode of hospitalization, a facility identifier, diagnostic codes, and Diagnostic Related Group (DRG) codes associated with each episode. The records do not include a unique patient identifier. The Hospital Discharge Data Set provided information on 42,628 episodes of hospitalization in 14 general hospitals in Vermont, more than 27 general hospitals in other states, and veterans administration hospitals.

Data on episodes of hospitalization that occurred at the Vermont State Hospital (the state's only public psychiatric facility) were obtained from a standard State Hospital Inpatient Episode Data Set (Leginski, et. al., 1989). Records that describe every hospitalization of an adult at the state hospital during 1990 through 2002 were abstracted by the research team. This data set contains information on the date of birth, gender, and zip code of each patient, the beginning and end dates of each episode, and diagnostic codes. The Vermont State Hospital data set also includes a unique patient identifier that was used to validate the estimation procedures described below. The Vermont State Hospital data set provided information on 4,727 episodes of hospitalization that involved 4,054 unique individuals.

Data on episodes of hospitalization of Vermonters that occurred at the Brattleboro Retreat were provided to the project by that institution. Records included information on the date of birth, gender and zip code of each patient, the beginning and end dates of each episode, and diagnostic codes for all Vermont residents. (Since historical zip code information was not maintained by The Retreat, records were selected on the basis of current residence, even for discharged patients.) The Brattleboro Retreat data set also included a unique patient identifier that was used to validate the estimation procedures. The Brattleboro Retreat data set provided information on 7,540 episodes of hospitalization involving 5,936 Vermonters.

Together, these data sets provide a comprehensive accounting of the amount of inpatient behavioral health care provided to Vermonters during 1990 through 2002. The major shortcoming of this aggregation of data sets is the lack of unique client identifiers that would allow the research team to determine the number of people who were

hospitalized for behavioral health care, and to determine the degree to which individuals are served in more than one type of facility. The method of Probabilistic Population Estimation described below is designed to allow researchers and evaluators to address these and other questions about the number of people served and the number of people shared by different service sectors when these sectors do not share a common client identifier.

An episode of hospitalization for “Mental Illness” in this report is defined by *at least one diagnosis within MDC 19*. These episodes could also be associated with one or more diagnoses for substance abuse. An episode of hospitalization for “Substance Abuse” in this report is defined by *at least one diagnosis within MDC 20*. These episodes could also be associated with one or more diagnoses for mental health. An episode of hospitalization for “Behavioral Health Care” in this report is defined by *at least one diagnosis within MDC 19 and/or at least one diagnosis within MDC 20*. Since patients can be diagnosed within both MDC19 (Mental Illness) and MDC20 (Substance Abuse) during the same episode of hospitalization, data reported for Behavioral Health Care as a whole may be lower than the sums of data reported for mental health and substance abuse.

Methodology

Many of the patient counts presented in this report are based on Probabilistic Population Estimation, a statistical procedure that allows policy analysts and evaluators to answer two basic questions that have frequently remained unanswered because existing data sets lack unique person identifiers across organizations and service sectors. “How many people have contact with a service system?” and “How many people are served by more than one organization or service system?” The ability to provide probabilistic estimates (with known confidence intervals) of these basic parameters of service systems is particularly valuable where issues of confidentiality or organizational complexity limit the availability of unique identifiers (Pandiani, Banks, and Schacht, 1998).

Probabilistic Population Estimation is a statistical procedure derived from a solution to the classic mathematical “coupon collector problem” that was provided by Feller (1957). His problem was determining the number of randomly distributed collector cards that needed to be acquired in order to complete a set. His solution was based on the fact that the probability of adding a new card to the collection changes whenever a card is added. In the problem being addressed here, the number of unique individuals is analogous to the number of collector cards necessary to complete the set, and the number of dates of birth is analogous to the number of different collector cards in the collection.

In order to derive the estimate of the number of people represented in a data set that does not contain a unique client identifier, the complete data set was broken into smaller data subsets in which all records have the same gender and year of birth (e.g., all records for men born in 1965). The number of distinct birthdays that occurred in each data subset was counted. The number of people necessary to produce the observed number of birthdays was calculated using the following formula:

$$P_j(l_j) = \sum_{i=1}^{l_j} \frac{365}{365 - i}$$

where “ P_j ” is the population estimate for subset “j”, and “l” is the number of birthdays observed in the year. Confidence intervals for the estimate may be calculated using a similar procedure. Estimates of the total number of people represented in the complete data set and the confidence intervals for this estimate were obtained by combining the results for every year of birth and gender cohort in the original data set. Because this procedure uses the number of dates of birth represented in a data set, not the number of records in the data set, the data set may include multiple records for individual people (e.g., event or episode records).

Unduplicated numbers of people served overall, for each service sector, and for each Vermont county were determined using Probabilistic Population Estimation. Rates of hospitalization for behavioral health care were calculated using the actual population for each year (1990 through 2002) for the state as a whole, and for each geographical region. The utilization rates for people in different age and gender categories reported in Appendix C are based on age and gender specific population estimates.

In order to probabilistically determine the number of people shared across data sets that do not include a common person identifier, the sizes of three populations are determined and the results are compared. First, the number of people represented in each of two data sets (for instance one data set with state hospital patients and another data set with private psychiatric hospital patients) is determined. A third data set is formed by combining the two original data sets and determining the number of people represented in the combined data set.

The number of people who are shared by the two data sets is the difference between the sum of the numbers of people represented in the two original data sets and the number of people represented in the combined data set. This result occurs because the sum of the number of people represented in the two original data sets will include a double count of every person who is represented in both data sets. The number of people represented in the combined data set does not include this duplication. The difference between these two numbers is the size of the duplication between the two original data sets, the size of the caseload overlap.

When no one is represented in both data sets, the number of people represented in the combined data set is equal to the sum of the numbers of people represented in each of the original data sets; the data sets are mutually exclusive. When every person represented in the smaller of the original data sets is also represented in the larger of the two original data sets, the number of people represented in the combined data set is equal to the number of people represented in the larger of the two original data sets.

In terms of mathematical set theory (Whitehead and Russell, 1927), the intersection of two sets ($A \cap B$) is the difference between the sum of the sizes of the two sets ($A + B$) and the union of the two sets ($A \cup B$):

$$(A \cap B) = A + B - (A \cup B)$$

The information on the number of people served in multiple service sectors reported in Appendix B are based on probabilistic estimation of caseload overlap.

Probabilistic Population Estimation provides valid and reliable estimates of population size that can be used to measure treated prevalence of disorders (Banks and Pandiani, 1998) and access to care (Pandiani, Banks, and Gauvin, 1997). Probabilistic determination of caseload overlap can be used to measure service system integration (Pandiani, Banks and Schacht, 1999) among a variety of service sectors. When caseload overlap is measured over time, powerful measures of treatment outcome can be produced (Banks, Pandiani, et. al., 1998, Banks, Pandiani, et. al., 1999, Pandiani, Banks and Schacht, 2001). For more information on the method of Probabilistic Population Estimation see (Banks and Pandiani, 2001).
